

LETTER

I have worked with software development about 25 years, since 2000. First half I worked with C and C++ development mostly with embedded systems. The later half I have worked with web-systems. Initially this was done in Javascript, NodeJS, ExpressJS, HTML and CSS and later Typescript, NodeJS, NestJS, ReactJS and styled components.

Source code is usually stored in git with GitLab or GitHub on top to help collaborate. Connected to that CI and CD pipelines help build, run tests and deploy. Software is packaged in NPM and Docker containers and run in Kubernetes. Issue tracking and documentation is often in Jira and Confluence.

Work-processes are normally iterative, Kanban or Scrum. I am used to work partly remote since 10 years. I can work alone but prefer a small team with skilled colleagues.

Lately AI and Copilot has become a part of my work to investigate, try things out and generate code. I have tried Spec kit as well to generate whole systems.

Working as consultant at Visionite (formerly Onegroup)

ASSIGNMENTS

Fixa

202309–present

Ikea INGKA · Malmö

Fixa is Ikea's internal store operations application – a suite of features bundled as one app for managing daily in-store tasks such as article restocking and showroom upkeep.

Working as a software developer I delivered two significant features: a unified filter component system replacing around five separate filter implementations across the app (reusable components handling varied filter configurations and state), and an in-store notification inbox pushing messages to the frontend via Server-Sent Events triggered by database changes – later extracted into a standalone Cloud Run service provisioned with Terraform. I also handled smaller features and bug fixes throughout.

The system is implemented in TypeScript with React/Styled Components/CSS Modules frontends using TanStack Query for data fetching, and Fastify/Knex backends (PostgreSQL). Initially each feature had its own frontend and backend repository with individual CI/CD pipelines; the backend repositories were later consolidated into a single Nx monorepo. All services are deployed to GCP and have a common Terraform setup. When Ikea migrated from Akamai to Cloudflare, internal HTTP 429 errors were resolved by adding VPC Connectors, Cloud Router, and Cloud NAT to the Cloud Run setup for private service-to-service routing. Development followed a weekly Kanban/Scrum mix with a focus on short, effective planning meetings.
